PRUNING SHEARS

One of the best ways to have beautiful flowering plants, for your entire growing season, is to keep the old dead blooms and leaves pruned from your plants. By pruning and trimming regularly you not only make the plant free of dead brown leaves and old flowers, you actually help the plant to produce more flowers in future days and weeks. To do this successfully a pair of VARO Pruning Shears are a very good addition to your gardening tool kit.

HANDY FLOWER SHEAR WITH STEEL BLADES AND SOFT GRIP HANDLES. PRECISELY SHARPENED FOR EASY AND CLEAN CUTTING.

Quality, stainless steel blades, precisely ground sharpened. Guarantees clean cuts. Very useful for grapes and other applications.

VG 1012

PRUNING SHEARS

There are two common types of pruning shears: bypass and anvil. Bypass shears have two curved blades that slide past each other like a pair of scissors. One blade is usually thick, with a mildly tapered edge; the other blade is thinner and sharpened. Anvil shears have one flat blade (anvil) and a second, straight-edged sharp blade that closes against the anvil. Most professional pruning shears are the bypass type; homeowner shears are available in both types.

These pruning shears have a non-stick coated blade that reduces friction and resists rust.

VG 1011

PRUNING SHEAR

VG 1017

The narrow pointed blades on these compact shears reach into tight spots where a big pruner can not, for cutting flowers, deadheading, and harvesting fruit. Ideal for singling out a stem in a dense flowerbed and for thinning container plants.

GRASS SHEARS

Designed specifically for thinning and trimming grass, the Varo Grass Shears feature all metal construction, hardened blades with blade angles carefully set for self-sharpening during use to ensure a good cutting edge.

A precision spring mechanism ensures that the blades are kept aligned in use on grass. The lever mechanism is designed for minimum effort in operating the shears. Blades can be set at different angles for varying applications. They rotate easily into three positions to enable the user to gain access to difficult-to-reach corners and edges which need trimming.

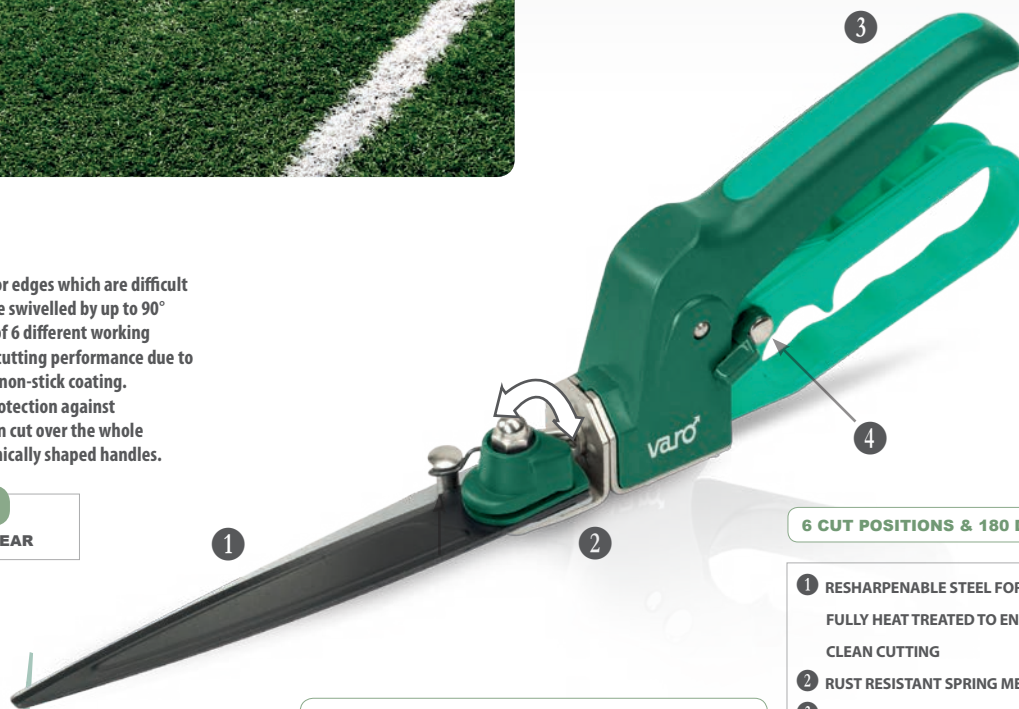

180°
handle swivel

Particularly suitable for edges which are difficult to get at. Blades can be swivelled by up to 90° to either side (a total of 6 different working positions). Optimised cutting performance due to hardened blades with non-stick coating. Enclosed handle for protection against injuries. Constant clean cut over the whole blade length. Ergonomically shaped handles.

VG 2003

GRASS SHEAR

6 CUT POSITIONS & 180 DEGREES SWIVEL

LOPPERS

THE DIFFERENCE BETWEEN ANVIL AND BYPASS?

Bypass

Blade and bill slide past each other like scissors

Best for: close, clean cuts on live branches

Not good for: dry, dead branches, which can get jammed between the blades, bending them

Anvil

Blade chops against soft plate, usually metal

Best for: chopping dead shoots and branches

Not good for: live branches, because anvil crushes soft stems

Bypass lopper

Choose bypass loppers when you want to trim back an overgrown shrub or tree that is healthy. The long handles give you more leverage, so you can cut bigger stems with less effort.

Anvil lopper

Let a rough-cutting anvil lopper do the grunt work of chopping off thicker dead branches or trimming back live ones before you make the final cut with bypass loppers.

VG 4002

VG 4004

LOPPERS

Lopping shears, or loppers as they are sometimes called, make quick work of heavy pruning jobs. Large rose canes and fruit tree branches are easily removed with the additional leverage the long-handled loppers provide. Keeping the blade sharp on loppers will make your pruning task even that much easier.

VG 4002

LOPPER

BYPASS BLADE

- Solid, economic type lopper
- Steel tubes and non slip handles
- Sturdy cushioned end stops are gentle on the wrists

- Telescopic lopper extendable from 62 to 95cm
- Clean, easy and exact cut from hardened non-stick blades
- Ergonomically shaped handles for convenient working

- Fully hardened, non-stick bypass blades for easy and exact cutting

VG 4006

LOPPER

BYPASS BLADE

- Professional aluminium lopper, lightweight yet very solid
- Double transmission system for effortless cutting
- Anvil cutting blades are most efficient for dry, hard wood

VG 4007

LOPPER

ANVIL BLADE

The anvil lopper is designed for cutting old, hard and dead wood. The anvil supports a broad area of the branch while the sharp and narrow blade is forced through the wood with only a minimum amount of slicing motion. These loppers are designed to deal with larger branch diameters and especially for professional gardeners, who may make thousands of pruning cuts in one day. For the best quality of cut.
